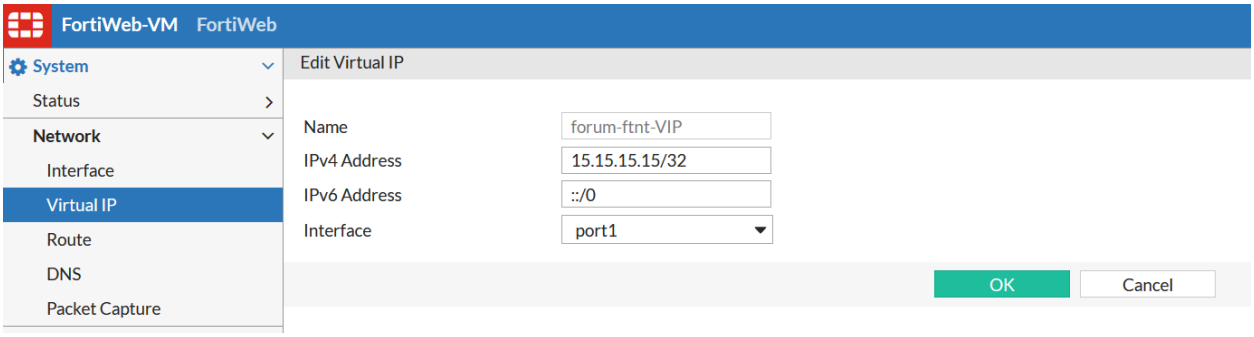
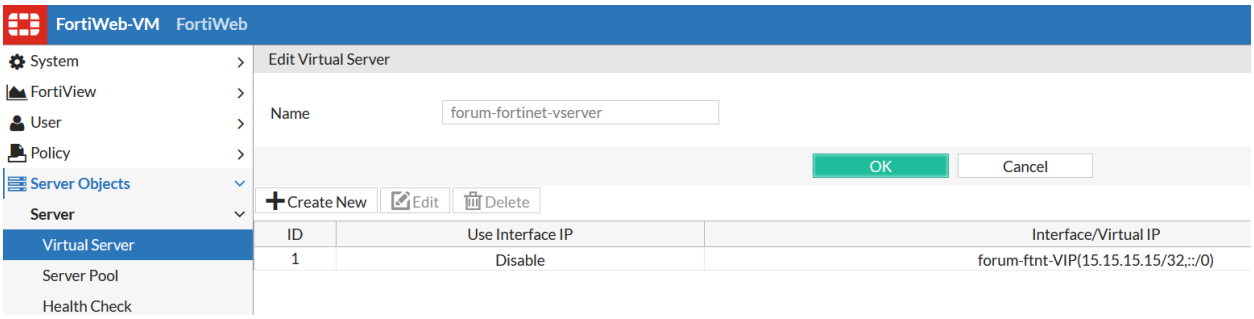
NOTE: This document is an answer to the question asked on https://forum.fortinet.com/FindPost/183028

In a word, the question is how to route www.example.com/server1 to the physical server 1 listening on port 22, and www.example.com/server2 to the physical server 2 listening on port 3030.

1. Create usual VIP representing the external IP, here it is 15.15.15.15:



2. Create Virtual Server using the above VIP:



3. Create 2 physical servers, for each server in a farm using ports 22 and 3030 accordingly, here server1 is 10.10.10.10 port 22 and server2 is 10.10.10.15 port 3030:

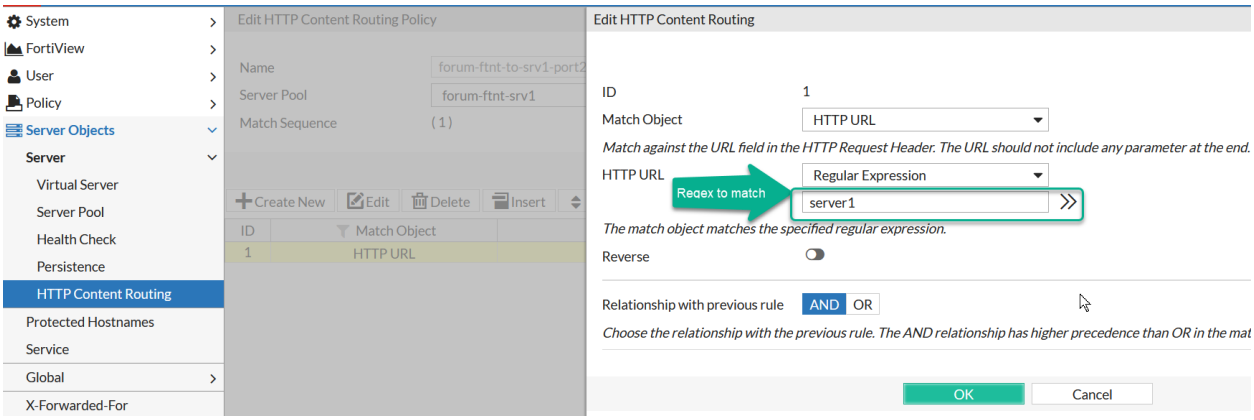
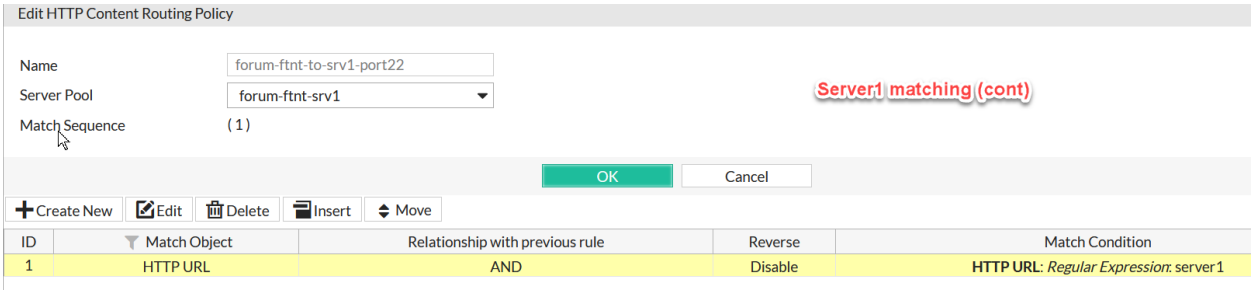
4. Now, to the HTTP Content Routing. Here we define parameters to route to different servers by. To do so we create 2 policies – first matching “server1” in URL (and route to server 1 10.10.10.10 by using it in the Server Pool menu), and the 2nd matching “server2”:





And for the 2nd server:

5. Finally, we tie all this together in the Server Policy of type HTTP Content Routing:
